

Assignment 7

1. Create Four global attribute (Data Type)

- a. partClassification (String)
- b. isDrawing (boolean)
- c. releaseDate (DateAndTime)
- d. height (real number)

2. Use these attributes in the wt.part.WTPart Object.

3. Create some Part objects, and populated these attributes.

4. Create SQL query for joins as well:

- a. From StringDefinition join StringValue join WTPartMaster join WTPart
- b. From booleanDefinition join booleanValue join WTPartMaster join WTPart
- c. From integerDefinition join integerValue join WTPartMaster join WTPart
- d. From timestampDefinition join timestamValue join WTPartMaster join WTPart

System Administration

Adapters Administration	Manage life cycle templates state mapping for the Requirements Management integration with Integrity.
File Server Management	Download light-weight file server installers and manage file servers
Import/Export Management	Manage the exchange of file data and metadata with other systems via XML files.
Mapping Management	Manage mappings to be used during package import.
Purge Management	Create and manage purge jobs.
Replication Scheduler	Create/Update replication rules and schedule replication sessions.

Business Administration

Business Rules	View the business rules.
Introduction to Numbering Schemes	View information on how to control numbers generated for objects.
Introduction to Versioning Schemes	View information on how to control identifiers generated for object versions.
Life Cycle Template Administration	Create and manage life cycle templates used for defining the phases and transitions of various business objects.
Object Initialization Rules Administration	Create and manage XML rules for object initialization that set default values for attributes and display characteristics that constrain attribute values.
Participant Administration	Support creation and modification of Windchill business objects describing users, groups, and organizations.
Policy Administration	Manage administrative domains and the access control, indexing, and notification policies.
Preference Management	View and set preferences.
Promotion Preference Management	View, create, and edit promotion preferences.
Publish and Thumbnail Control	Controls WVS publishing.
Report Management	Create, update, and delete reports using the QueryBuilder tool. A report is the output of a predefined search and is used for generating statistics and metrics against business information.
Team Administration	Create and manage team templates. When creating a life cycle-managed object, you can use a team template as a base for the team participants throughout its life cycle.
Type and Attribute Management	Manage type definitions, attribute definitions, measurement systems, and quantities of measure. Users with the appropriate permissions can create, modify, or remove types or attributes. Additionally, users can those attributes.
Visualization Configuration Administration	Manage WVS configurations including Creo View preferences, watermarks, printer configurations, dynamic groups and publish rules.
Workflow Template Administration	Create and manage workflow templates used for automating processes, in which information, tasks, and documents are passed among participants, within the context of specific business objects.
Workflow Process Administration	Search for workflow processes and view activity and task level details. Restart stalled workflows, terminate or delete workflows.
WVS Job Monitor	View the status of WVS Jobs.
WVS Job Scheduler Administration	Create and execute WVS jobs.

Auditing Administration

Organization Usage Reporting	View an organization usage report.
Security Audit Report Queries	View security audit report queries.
Security Audit Reporting	Create and view security audit reports and save report queries.

join wtpartmaster wtpa on wtp.ida3masterreference=wtpa.ida2a2
where displayname like 'Part*';

String defination is table 1 and string value is table 2, we need common data from both tables so we are using inner join, here IDA2A2 is primary key and the same data or column is available in the string value table also with different column name that is IDA3A6 and this becomes the foreign key for us in this case.
Similarly for boolean, int, date time data types the table names are 1.booleandefinition and boolean value 2.integerdefinition and integervalue 3.timestampdefinition and timestampvalue.
